Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

### 1. Problem Statement

John and Mary are collaborating on a project that involves data analysis. They each have a set of age data, one sorted in ascending order and the other in descending order. However, their analysis requires the data to be in ascending order.

Write a program to help them merge the two sets of age data into a single sorted array in ascending order using merge sort.

# **Input Format**

The first line of input consists of an integer N, representing the number of age values in each dataset.

The second line consists of N space-separated integers, representing the ages of participants in John's dataset (in ascending order).

The third line consists of N space-separated integers, representing the ages of participants in Mary's dataset (in descending order).

Output Format participants in Mary's dataset (in descending order).

The output prints a single line containing space-separated integers, which represents the merged dataset of ages sorted in ascending order.

Refer to the sample output for formatting specifications.

#### Sample Test Case

```
Input: 5
13579
    108642
    Output: 1 2 3 4 5 6 7 8 9 10
    Answer
    #include <stdio.h>
    // You are using GCC
    void merge(int arr[], int left[], int right[], int left_size, int right_size) {
       //Type your code here
       int i = 0, j = 0, k = 0;
       while(i < left_size && j < right_size)
         if(left[i] < right[j])</pre>
            arr[k++] = left[i++];
         } else
           arr[k++] = right[j++];
       while(i < left_size)
         arr[k++] = left[i++];
while(j < right_size)
```

```
arr[k++] = right[j++];
      void mergeSort(int arr[], int size) {
        //Type your code here
           if(size < 2) return;
        int mid = size / 2;
        int left[mid], right[size - mid];
        for(int i = 0; i < mid; i++)
           left[i] = arr[i];
        for(int i = mid; i < size; i++)
           right[i - mid] = arr[i];
        mergeSort(left, mid);
        mergeSort(right, size - mid);
        merge(arr, left, right, mid, size - mid);
     int main() {
        int n, m;
        scanf("%d", &n);
        int arr1[n], arr2[n];
        for (int i = 0; i < n; i++) {
           scanf("%d", &arr1[i]);
        for (int i = 0; i < n; i++) {
           scanf("%d", &arr2[i]);
        merged[n + n];
mergeSort(arr1, n);
mergeSort(arr2, n);
merge(m)
  int merged[n + n];
        for (int i = 0; i < n + n; i++) {
           printf("%d ", merged[i]);
        }
        return 0;
     }
      Status: Correct
                                                                                    Marks: 10/10
```
